C)Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C, Superfamily: immunoglobulin C region; immunoglobulin c region; immunoglobulin hemology
C, Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin

                             the d12 allotypic marker, 104-Thr, and the e14 marker, 185-Thm
                                                                                                                                      the Fd sections of rabbit immunoglob
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A Accession: A94416
A; Accession: A94416
A; Molecule type: protein
A; Residues: 129-131;155-172,'D',174-184,'A',186,'E',188-200,'D',202-217,'E',219-232,'O', A; Residues: 129-131;155-172,'D',174-184,'A',186,'E',188-200,'D',202-217,'E',219-232,'O', A; Note: this has the e15 allotypic marker, 185-Ala
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap and issulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C; Superfamily: immunoglobulin C region; immunoglobulin homology
C; Reywords: duplication; glycoprotein; heterotetramer; immunoglobulin

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C;Superfamily: immunoglobulin c region; immunoglobulin homology C;Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin homology <a href="https://www.rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/rman.com/r

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                          Q45224 is CDNA from clone 1 of library WI-26 VA4 of human fibroblast cell line WI-26 VA4. The mature full-length TNFRI is a glycoprotein baving a mol. wt. of about 75-80 kba.The clohing of the CDNA for TNFRI was described in Smith et al., Science 248:1019,1990. Clone 1 is contained in expression vector pCAV/NOT-TNFR (ATCC 68008). A scontained in expression vector pCAV/NOT-TNFR (ATCC 68008). A crombinant chimeric antibody may be produced having TNFR sequences substituted for the variable domains of either or both of the immunoglobulin molecule heavy and light chains and having unmodified constant region domains. A specific example of a TNFR/FC fission protein is given in Q4525/FS1003. The rub TNFR: Fe fusion protein is given in Q4525/FS1003. The rub TNFR: Fe fusion protein is given in Q4525/FS1003. The rub TNFR: ATCC G8089) conty the cDNA encoding the truncated TNFR. 2) a 700 bp Styl-Spel fragment from plasmid pIXY498 coding for 232 AAS of the CF portion of human IgG1. Plasmid pIXY498 coding for 232 AAS of the CF crost conty. The FC fragment of human IgG1. 3) An oligo linker, to conty the FC fragment of human IgG1. 3) An oligo linker, to linker was created TNF receptor and the 5' end of human IgG1, cend of the truncated TNF receptor and the 5' end of human IgG1, 237. Apriner Q45226, which encodes the 257.237 of human IgG1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  254

The sequence is that of fusion protein TNFRFC comprising the extracellular domain of tunnour necrosis factor (TNF) fused via a hinge region to the FC part of the heavy chain of human 1961. It may be used as part of a cell free receptor binding test which can be used for the identification of agonists, antagonists, antibodies, biological activity of soluble cellular receptors, functional analysis of modified ligands and diagnostic or therapeutic substances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   103 dqvetqactreqnrictcrpgwycalskqegcrlcaplrkcrpgfgvarpgtetsdvvck 162

The invention provides the use of Fas antagonist as an agent for the treatment and prevention of apoptosis related diseases. The Fas antagonist can be a partial Fas antigen peptide containing the extracellular part of the protein, but lacking the signal sequence, an anti-Fas antibody, or an anti-Fas ligand antibody, where the antibody is preferably a humanised antibody. The Fas antagonist is used in the treatment and prevention of diseases such as myocardial infarction, heart disease, ischemic restencies of the heart, liver or kidney and endotoxic shock, and also as an organ preservative in transplantation. The agent is of low toxicity but effectively inhibits the Fas/Fas ligand
                                                                          Fas ligand; Fas antagonist; apoptosis related disease; liver disease; heart failure; kidney failure; graft-versus-host disease; antibody; myocardial infarction; ischemic restenosis; endotoxic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This represents the antigenic peptide has (nd29) containing the Fc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 QPREPQVYTLPPSRDELTKNQVSLTCLVKGFYPSDIAVEWESNGQPENNYKTTPPVLDSD
                                                                                                    amino-terminal to (but excluding) the 1st cysteine residue (preferably at least 29 residues are deleted).

The derivative is an effective regulator of apoptosis and can be used (either by administration of the polypeptide, or by the use of the coding DNA in gene therapy) to treat a range of diseases, e.g. diabetes, arthritis, lupus and in particular viral diseases such as hepatitis, influenza and HIV, by modulating apoptosis of virus-infected cells.
                                                                                                                                                                                                                                                                                90;

                                                                                                                                                                                                                                                                                                                                                                                            This plasmid encodes an OX40/Fc antibody fragment mutein protein, and is used to express a soluble OX40/Fc mutein fusion protein for use in detecting cDNA clones encoding a OX40 ligand. The Fc fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EBNA (ATCC CRL 10478) monkey kidney cell line. Cultures supernatant was purified by affinity chromatography and this was used, together with labeled goat anti-human IgG to screen various cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          crecqpghqmvnrcdhtrdtlchpcetgfyneavnydtckqctqcnh--rsgselkqnct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the OX40/Fc fusion protein that contains the extracellular domain of mouse OX40 fused to the mutated Fc region of the human IgG1 antibody. The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytckine (W48975) that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed

Cell development cycle protein of delta family useful for treating various disorders associated with central nervous system e.g. cerebral autosomal dominant ateriopathy and ischemic strokes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a fusion protien of the extracellular domain of a murine polypeptide, which a member of the cell development cycle protein family known as the Delta family of mammalian membrane surface-bound ligands, and the human immunoglobulin G (IGG) Fc portion. The murine delta-related protein gene is expressed
                                                                                                                                                                                         30

       in the control of endothelial cell biology. The murine polynucleotide was identified from a white adipose tissue cDNA library. The polypeptide is useful for identifying receptors, which bind to and/or are activated by the polypeptide. The polynucleotide is useful in gene therapy of cerebral autosomal dominant ateriopathy with subcortial infarcts and leucoencephalopathy, an autosomal dominant disorder causing ischemic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryotic vector encoding growth factor, thrombin cleavage site and human 1gG1 Fc region - esp. encoding EGF-like domain of herequlin-alpha, -beta2 or -beta3, used for prodn. of recombinant fusion proteins capable of HER4 receptor activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              rHRG-alpha-T-Fc (W06683) is a fusion protein that incorporates the EGF-11ke binding domain of human herequlin (HRG)-alpha and the Fc portion of human IgG1. It is the product of a cDNA construct (T45262) in vector CDM and can be producted in eukaryotic (esp. COS) host cells. The fusion protein, or the HRG-alpha EGF binding domain produced from it by thrombin cleavage, are both capable of activating human epidermal growth factor receptor 4 (HBR4) and can be used to study receptor functioning, e.g. protein phosphorylation. They are also useful in screening assays for (ant)agonists of HBR3 and HBR4, and bind to cells that express HBR4 e.g. MDA-MB-453 human breast cancer cells, inducing expression of intercellular adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nvpmkvg------propertygkdpgggggrlvprgfgsgd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fnwyvdgvevhnaktkpreegynstyrvvsvltvlhgdwlngkeykckvsnkalpapiek

oplypeptides are proteinases implicated in fertilisation and spermatogenesis. They can be used as therapeutic agents. A proteinase inhibitor of the catalytic domain would inhibit SyPH1-26 activity and would be useful as a method for birth control. Also, an inhibitor of the catalytic domain object fertilisation. The proteinase disintegrin domain of SyPH1-26 may affect fertilisation. The proteinase activity of SyPH1-26 can also be used as a detergent additive for the removal of stains having a protein component. The SyPH1-26 polypeptides and fragments can also be used as molecular weight markers, as markers for determination of isolectric points of sample proteins and as controls for establishing the extent of fragmentation of a protein sample. The products can also be used for identifying, separating or sample. The products can also be used for identifying, separating or purifying cells that express SyPH1-26 polypeptides such as testis cells. The present sequence represents a fusion protein from an example of the present invention comprising; the IG Kappa signal sequence at positions 1 to 20; a spacer at positions 21 to 22; the SyPH1-26 disintegrin domain at positions 308 to 535.
                                                                                                                                                                                                                SVPH1-26 disintegrin domain, Ig kappa signal, Fc IgG1 fusion protein.
                                                                                                                                                                                                                                             Human, SVPH1-26, proteinase, testis, fertilisation, spermatogenesis, birth control, detergent additive, diagnosis; testicular cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human SVPH1-26 DNA useful for the diagnosis and prognosis of testicular cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes human SVPH1-26. Human SVPH1-26

                                                                                                                                                ŏ
                                                                                                                                                                                                                                                                                     This represents an integrin beta-1 chain. The invention provides integrin-immunoglobulin chimeric protein heterodimer complexes that complians alpha or beta chain associated with an integrin alpha chain and confidence confidence complexes. In particular with a chimeric proteins form heterodimer complexes, in particular with a chimeric protein containing an integrin beta chain and an immunoglobulin chain, at the immunoglobulin chain, and an immunoglobulin chain; the immunoglobulin chain. The integrin alpha chain is preferably alpha 4 two may be a light chain. The integrin alpha chain is preferably alpha 4 transformed with vectors containing the DNA coding for the above chimeric proteins can be used in the preparation of the chimeric proteins and their heterodimer complexes. The heterodimer complexes, which are useful for testing potential promoters and inhibitors of the binding of integrins to thair ligands, function as blood platelet substitutes and integrin agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15;

The present sequence represents human neurturin receptor alpha

(NTNR-alpha)/FC sequence (IfF2a) fusion protein, from an example of the present invention. WINR-alpha proteins can be used: (a) to identify molecules that bind specifically to it (potential agonists and antagonists) and to purify such compounds: (b) to modulate response of cells to neurturin (NTN); (c) to increase survival of Ret-expressing cells or to activate Ret on the surface of cells (soluble glial derived neurotrophic factor receptor (GDNFR alpha) may be used the same way); (d) to increase the half-life of cognate ligands (soluble glial derived adminant feed additive or molecular weight marker. NTNR-alpha, its genes, animal feed additive or molecular weight marker. NTNR-alpha, its genes, animal feed additive or molecular weight marker. NTNR-alpha, its genes, cant) agonists and antisense nucleic acids, are useful in vivo or ex vivo for treating conditions related to abnormal NTN activity or response, particularly neurological (central or enteric), renal or haematopoietic (spleam) diseases or injuries. Ab may be agonists or antagonists for therapeutic use (e.g. as antagonists to treat excessive/unwanted NTNR-alpha expression, e.g. in some tumours), also reagents for immunoassay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                    qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a neurturin receptor alpha (NTNR alpha). NTNR alpha binds neurturin. The NTNR alpha nucleic acid molecule is useful for the expression of NTNR alpha, which may be used to identify agonist and antagonist compounds having therapeutic applications, such thrombocytopaenia, hypoplasia, treating anaemia, thrombocytopaenia, hypoplasia, or haemorrhage. The present sequence is a NTNR alpha and IgG (immunoglobulin G) fusion protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid molecule encodes a neurturin receptor-alpha amino acid sequence excluding the N\text{-terminal} signal peptide -

```
The present sequence represents rat neurturin receptor alpha (NTMR-alpha)/FC sequence (IFT2a) fusion protein, from an example of the present invention. NTNR-alpha proteins can be used: (a) to identify molecules that bind specifically to it (potential agonists and antagonists) and to purify such compounds; (b) to modulate response of cells to meutrurin (NTN); (c) to increase survival of Ret-expressing cells or to activate Ret on the surface of cells (soluble glial derived neurotrophic factor receptor (GDNFR alpha) may be used the same way); (d) to increase the half-life of cognate ligands (sepecially NTN); (e) animal feed additive or molecular weight marker. NTNR-alpha, its genes, animal feed additive or molecular weight marker. NTNR-alpha, its genes, cartlagonists and antisense nucleic acids, are useful in vivo or ex vivo for treating conditions related to abnormal NTN activity or response, particularly neurological (central or enteric), renal or haematopoietic (splean) diseases or injuries. Ab may be agonists or antagonists for therapeutic use (e.g. as antagonists to treat excessive/unwanted NTNR-alpha expression, e.g. in some tumours), also reagents for immunoassay and affinity purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11;

The present invention describes a neurturin receptor alpha (NTNR alpha). NTNR alpha binds neurturin. The NTNR alpha nucleic acid molecule is useful for the expression of NTNR alpha, which may be used to identify agonist and antagonist compounds having therapeutic applications, such as enhancing splenic haematopoiesis, treating anaemia, thrombocytopaenia, hypoplasia, or haemorrhage. The present sequence is a NTNR alpha and 196 (immunoglobulin G) fusion protein from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acid molecule encodes a neurturin receptor-alpha amino acid sequence excluding the N-terminal signal peptide \dot{\cdot}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        73 KQECNRTHNRVCECKE--------GRYLEIEFCLKHRSCPPGFGVVQAGT 114

The present sequence is porcine CTLA-4-Ig construct for xenograft -specific immunosuppression. In a pig-to-human transplantation, the soluble protein could comprise the extracellular domain of porcine CTLA-4 fused to a human C gamma I chain of IgG1. This construct was subcloned into the expression vector pHOOK-3TM and used to transfect DAP.3 or CHO-KI cells. PCTLA-4-Ig preferentially binds to porcine B7 and blocks its interaction with CDSB on recipient T-cells. This is useful as a species-specific reagent to inhibit human T-cell proliferative responses to a variety of stimulators.
                                                                                                                                                                                                              Porcine CTLA-4; soluble protein; xenograft; organ transplant; B7; CD28; xenograft-specific immunosuppression; recipient T-cell; anergy; co-stimulatory signal 2; homology; human CTLA-4; bovine CTLA-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting T-cell mediated rejection of xenotransplanted organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /label-Flexible_linker

OSTBOCLASTOGRNESIS BY INTERUPTING CELL-TO-CELL SIGNALING BETWEEN
STROMAL CELLS AND OSTBOCLAST PROGENITORS.
STROMAL CELLS AND OSTBOCLAST PROGENITORS.
SUBCELLUIAR LOCATION: EXTRACELLUIAR.
TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN LIVER, LUNG,
PLACENTA. NOT DETECTED IN SPLEEN.
DEVELOPMENTAL STAGE: IN THE EMBRYO, HIGH LEVELS ARE DETECTED AT
DEVELOPMENTAL STAGE: IN THE EMBRYO, HIGH LEVELS ARE DETECTED AT
DEVELOPMENTAL STAGE: IN THE EMBRYO, HIGH LEVELS ARE DETECTED AT
DAY 7. AT DAY 11, EXPRESSION DECREASES AND THEN INCREASES FROM DAY
15 TO DAY 17.
